associated signaling molecules.";
J. Cell Biol. 152:959-970(2001).
-!- FUNCTION: The JNK-interacting protein (JIP) group of scafiproteins selectively mediates JNK-signaling by aggregating specific components of the MAPK cascade to form a function specific components of the MAPK cascade to form a function signaling module. May function as a regulator of vesicle transport, through interactions with the JNK-signaling com and motor proteins
-!- SUBUNIT: Forms homo- or heterooligomeric complexes. The cascade of Mapk!

DEVELOP
IN THE BRAIN.
SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS
TYPE CARBONIC ANHYDRASE FAMILY.
SIMILARITY: Contains 2 protein-tyrosine phospha
SIMILARITY: Contains 1 fibronectin type III dom
CAUTION: CALLED RPTPASE BETA IN REF.2 AND REF.4
                                                                                                                                                                                                                                                                                                                                                                                           ISOId=P23471-2; Sequence=VSP 005151;
TISSUE SPECIFICITY: SPECIFICALLY EXPRESSED IN THE CENTRAL SYSTEM, WHERE IT IS LOCALIZED IN THE PURKINJE CELL LAYER CEREBELLUM, THE DENTATE GYRUS, AND THE SUBEPENDYMAL LAYER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SIMILARITY).

FUNCTION: Binding to cells via a high affinity receptor, laminin is thought to mediate the attachment, migration, and organization of cells into tissues during embryonic development by interacting with other extracellular matrix components.

SUBUNIT: Laminin is a complex glycoprotein, consisting of three different polypeptide chains (alpha, beta, gamma), which are bour to each other by disulfide bonds into a cross-shaped molecule
                                                                                                                                                                                                                                                                                                             s SWISS-PROT entry is copyright. SIMILARITY: STRONG, TO DROSOPHILA BRAHMA.
SIMILARITY: Contains 1 bromodomain.
SIMILARITY: Contains 3 A.T book DNA-binding repeats.
SIMILARITY: BELONGS TO THE SNF2/RAD54 HELICASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: INVOLVED IN TRANSCRIPTIONAL ACTIVATION. THE SWI/SNF COMPLEX IS REQUIRED FOR THE INDUCED EXPRESSION OF A LARGE NUMBER OF GENES. THIS COMPLEX ALTERS CHROMATIN STRUCTURE TO FACILITATE BINDING OF GENE-SPECIFIC DEDICATED TRANSCRIPTION FACTORS.

SUBUNIT: COMPONENT OF THE SWI/SNF GLOBAL TRANSCRIPTION ACTIVATOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                M61703; AAA35059.1;
